

A study material for M.Sc. Biochemistry (Semester: IV) Students  
on the topic (EC-1; Unit I)

# **Taxonomy of Bacteria**

Classification of the invisibles

**Vyomesh Vibhaw**

Assistant Professor (Part Time)

Department of Biochemistry

Patna University

# Taxonomy

Taxonomy - the science of biological classification

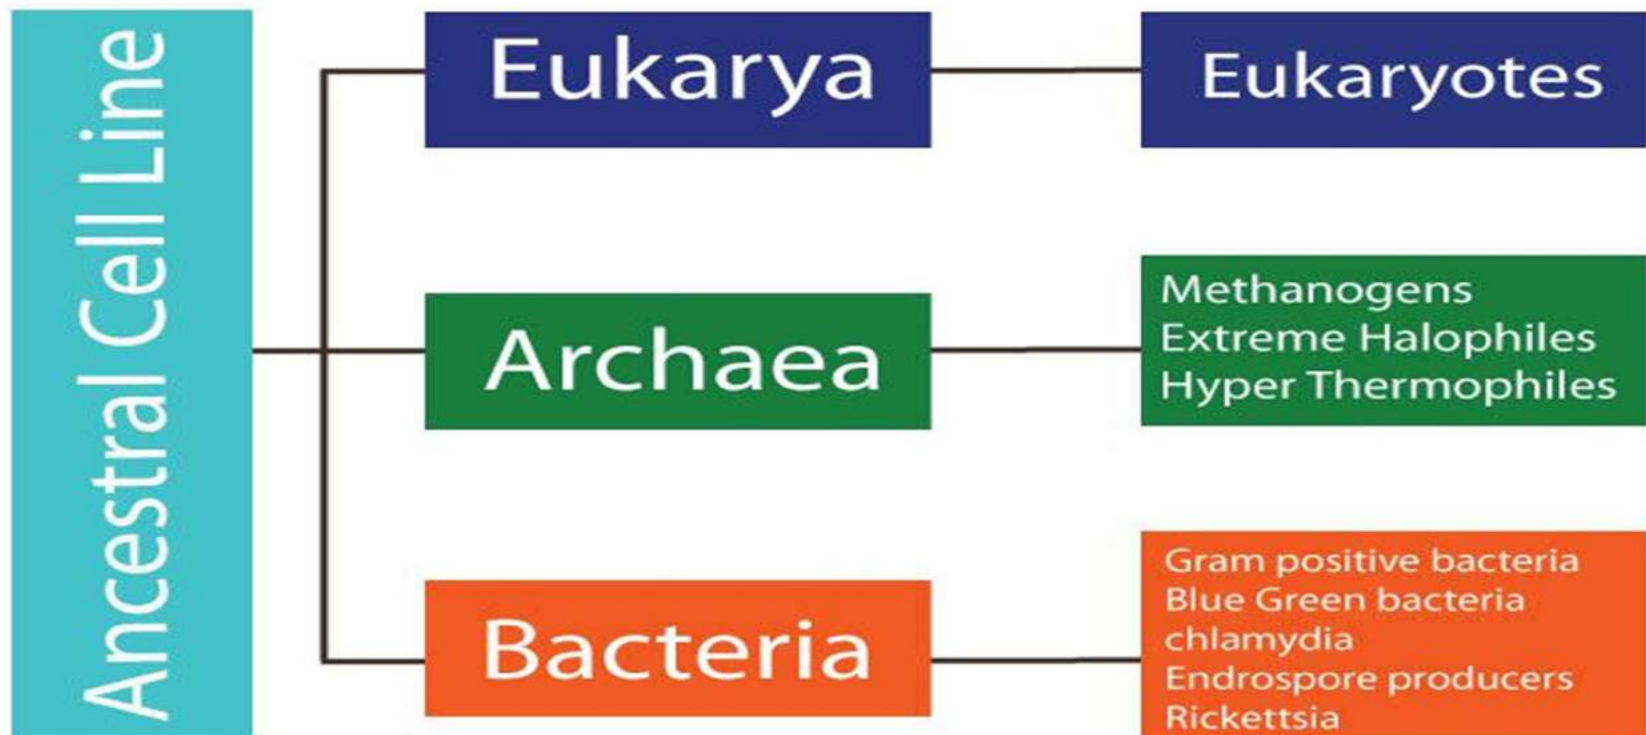

Microbial Taxonomy is a means by which microorganisms can be grouped together. Organisms having similarities with respect to the criteria used are in the same group, and are separated from the other groups of microorganisms that have different characteristics. Taxonomy is the science of biological classification. Classification is the arrangement of organisms into groups (taxa) Nomenclature refers to the assignment of names to taxonomic groups. Identification refers to the determination of the particular taxon to which a particular isolate belongs.

- In other words- It is a branch of science that deals with identification, nomenclature and Classification of any organism.
- **Classification** - arrangement of organisms into groups or taxa (s., taxon) based upon similarities or evolutionary relatedness
- **Nomenclature** - assignment of names to taxonomic groups using special rules
- **Identification** - determining to which recognized taxon a particular organism belongs.

**Systematics:** Study of organisms with the ultimate objective of characterizing and arranging them in an orderly manner

## Importance of taxonomy

- Permits the organization to organize huge amounts of information about organism
- Allows predictions and hypotheses to be made upon this information
- Places organisms in useful groups with precise names that permit effective communication between investigators
- Essential for the identification of organisms

# Hierarchical arrangement in Taxonomy

Domain: Bacteria

Phylum: Proteobacteria

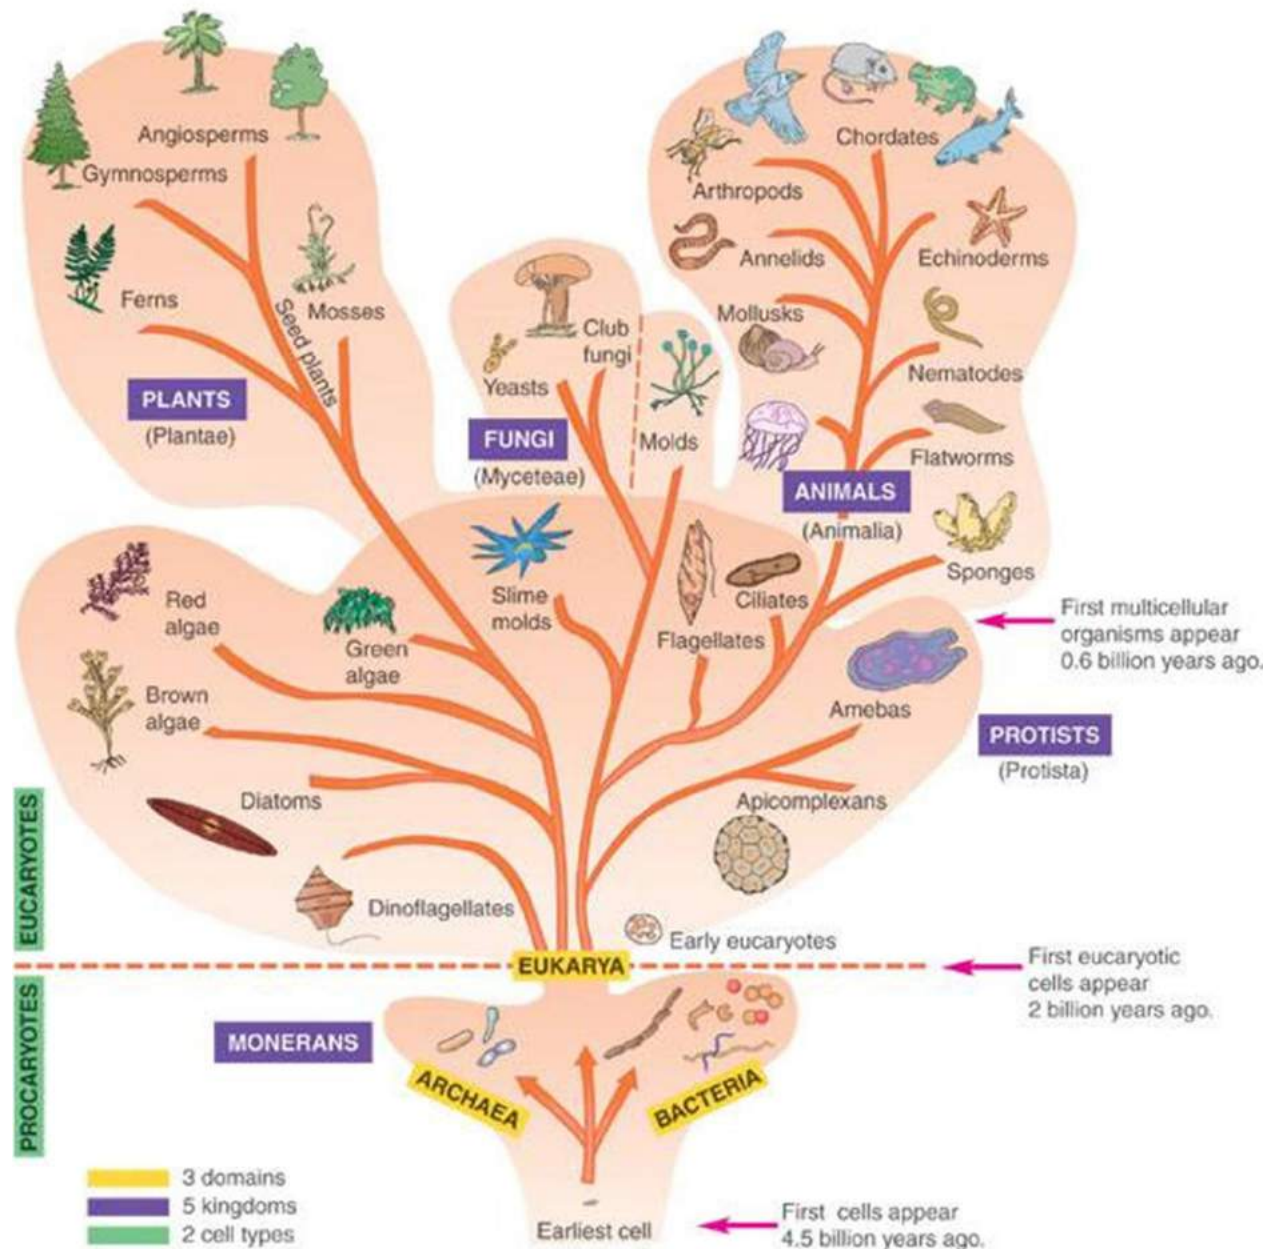

Class: Gamma Proteobacteria

Order: Enterobacteriales

Family: Enterobacteriaceae

Genus: *Escherichia*

Species: *Escherichia coli*

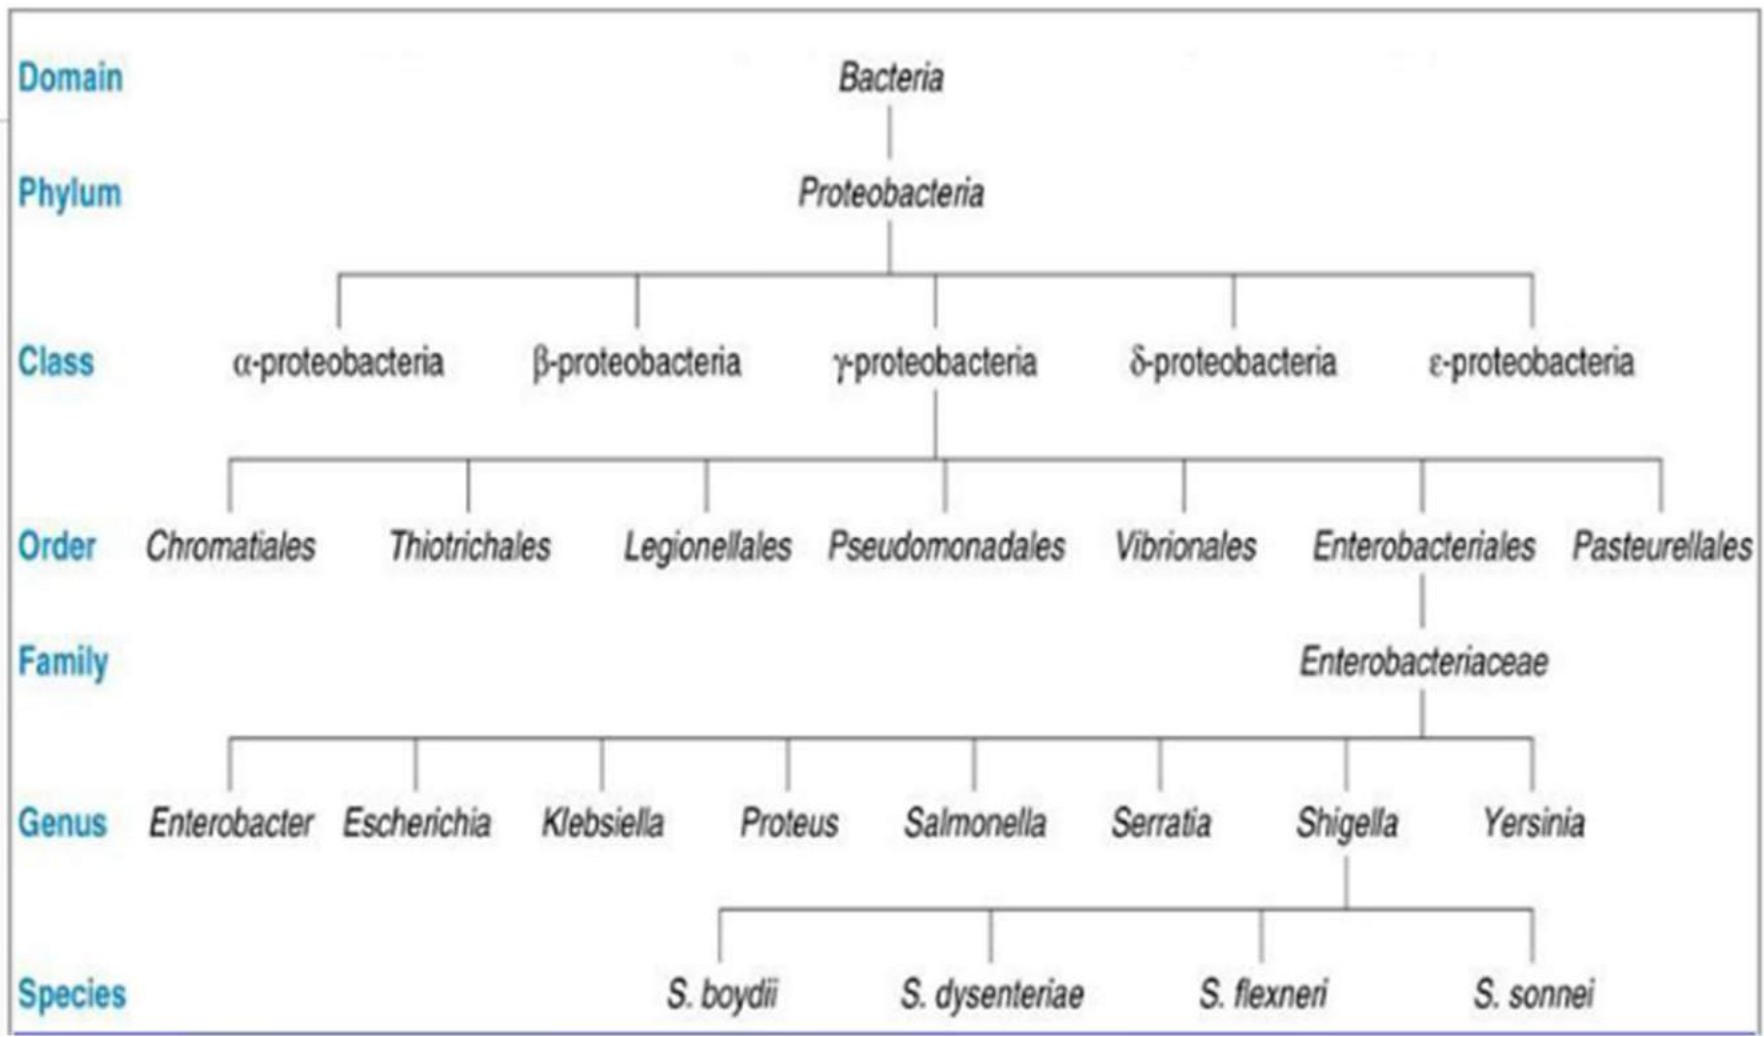

# The Phylogeny of Archaea

# The Phylogeny of *Eukarya*

## Criteria for the classification of bacteria

- Morphological characteristics
- Physiological and metabolic characteristics
- Ecological characteristics
- Biochemical Characteristics
- Serological method
- Genetic analysis
- Molecular characteristics

### Morphological characteristics

- Cell shape
- Cell size
- Cilia and flagella
- Cellular inclusions
- Color
- Endospore shape and location
- Spore morphology and location
- Colonial morphology
- Staining behavior

# Physiological, Metabolic and Ecological Characteristics

- Carbon and nitrogen sources
- Cell wall constituents
- Energy sources
- Fermentation products
- Motility
- Osmotic tolerance
- Storage inclusions
- General nutritional type
- Growth temperature optimum and range
- pH optimum and growth range
- Photosynthetic pigments
- Salt requirements and tolerance
- Secondary metabolites formed
- Sensitivity to antibiotics

## Biochemical Characteristics

- Fermentation of carbohydrates.
- Hydrolysis of starch and cellulose
- Production of indole, hydrogen sulphide, acetyl methyl carbonol, etc. in media
- Reduction of Nitrate, Sulphate, Methylene blue or Litmus in media.
- Production of specific enzymes (Phosphatase, Hyaluronidase, Cellulase etc.)

## Serological method

- Use group specific antiserum isolated from the plasma of organism that have been sensitized to the organism
  - The antiserum contains antibody proteins that react with antigens on the unknown organism.
  - The reaction can be detected by examining agglutination or by using sera labeled with fluorescent labels

## Genetic analysis

- The study of transformation and conjugation and Transduction in bacteria.
- Extrachromosomal elements such as Plasmid, Transposon etc.
- Life cycle i.e. Lytic cycle and Lysogenic cycle.

# Molecular characteristics: Proteins or Genes

- **DNA fingerprinting**
- **Comparison of Proteins**
  - Determination of Amino Acid sequence
  - Comparison of electrophoretic mobility

- **Nucleic acid base sequence:**

$$\text{Mol\% (G + C)} = \frac{\text{G + C}}{\text{G + C + A + T}} \times 100\%$$

- Estimated by determining the melting temperature of the DNA
  - Higher G + C gives a higher melting temperature
- **Nucleic acid sequencing**
- **Nucleic acid hybridization**
  - By mixing ssDNA from two different species and determining the percentage of the DNA that can form dsDNA hybrids
  - The greater the percent hybridization, the closer the species
- **16 S rDNA sequence analysis:**
- Highly conserved primer binding sites.
- Gene sequences contain hypervariable regions that can provide species-specific signature sequences useful for bacterial identification

## Numerical Taxonomy (Taximetrics)

- The branch of taxonomy that uses mathematical methods to evaluate observable differences and similarities between taxonomic groups.
- It aims to create a taxonomy using numeric algorithms like cluster rather than using subjective evaluation of their properties.
- The concept was first developed by Robert R. Sokal & Peter H. A. Sneath in 1963 but first it was approached by Adanson and hence it is called as **Adansonian Taxonomy**.
- All characteristics are given equal weight (either 0 , 1 or +, -) and a computer based analysis is carried out to group the bacteria according to shared properties.

### Logical Steps of Numerical taxonomy

- Collection of Data
- Coding of Data
- Calculation of Similarity or Dissimilarity Matrix based on computer analysis.
- Formation of Dendrogram
- Interpretation of results

Operation Taxonomic Units (OTUs) :

**Most taxonomic work with bacteria is carried out on individual strains** even though species, genera and bigger groups may also be studied. These entities are called OTUs.

# Bergey's Manual

- David Bergeys at University of Pennsylvania published in 1923 a manual for the identification of bacterial species and called it **Bergey's Manual of Determinative Bacteriology**.
- It classifies the bacteria only on the morphological character and do not include phylogenetic character (With out numerical taxonomy).
- Total eight editions of Bergey's Manual of Determinative Bacteriology is published.
- In 1984, a new approach was adopted in the compilation of Bergey's Manual. It was renamed as **Bergey's Manual of Sytematic Bacteriology** instead of it Bergey's Manual of Determinative Bacteriology. It includes phylogenetic character (With Numerical taxonomy).
- Total Two editions of this manual is publishes and each edition contains four volumes.

## **1<sup>st</sup> Edition:**

**1<sup>st</sup> Volume:** Gracilicutes: Bacteria with Gram negative cell wall

**2<sup>nd</sup> Volume:** Firmicutes: Bacteria with Gram positive cell wall

**3<sup>rd</sup> Volume:** Tenericutes: Bacteria lacking cell wall

**4<sup>th</sup> Volume:** Mendosicutes: Bacteria lacking peptidoglycan in cell wall

## **2<sup>nd</sup> Edition:**

- It was published in 2001. It is classified based on 16S rRNA (It was not in 1<sup>st</sup> edition)
- 2<sup>nd</sup> edition is more phylogenetic and systematic as compared to 1<sup>st</sup> edition
- It has 5 volume

**1<sup>st</sup> Volume:** Archaea

**2<sup>nd</sup> Volume:** Proteobacteria (Gram Negative)

**3<sup>rd</sup> Volume:** Low G+C gram Positive bacteria

**4<sup>th</sup> Volume:** High G+C gram positive bacteria

**5<sup>th</sup> volume:** Plectomycetes

## Acknowledgement and Suggested Readings:

1. Microbiology, An Introduction; Tortora, Funke and Case; Pearson Publication
2. Microbiology; Prescott, Harley and Klein; The MacGraw-Hill Companies
3. Microbiology: Principles and Explorations; Jacquelyn G Black; John Wiley and Sons Inc.
4. Brock Biology of Microorganisms; Madigan, Martinko, Stahl and Clark; Benjamin Cummings (Pearson Publication)
