### Modern Algebra–CC-1

#### Binary Composition or Binary Relation

Let  $S$  be a non-empty set. A binary relation  $*$  on  $S$  is a mapping  $*: S \times S \rightarrow S$  defined as  $*(a, b) = a * b$

Whether a composition is a binary composition on a set or not, it depends on the set.

For example : usual addition '+' is binary composition for the set of rationals but not a binary composition for the set of irrational numbers as the sum of two irrational numbers may not be irrational.

#### Algebraic structure

A set  $G$  equipped with one or more binary operation is called algebraic structure. Let  $G$  be a non-empty set and ' $*$ ', ' $\circ$ ' etc are binary operation on  $G$  then  $(G, *, \circ)$  etc is called algebraic structure.

#### Groupoid or Quasi Group

Let  $G$  be any non-empty set and  $*$  is a binary operation then the structure  $(G, *)$  is called a groupoid or Quasi –Group.

If the binary operation  $*$  in the set  $G$  satisfies the commutative property.

$$a * b = b * a \quad \forall a, b \in G$$

Then, the structure  $(G, *)$  is said to be a commutative groupoid.

#### Remark

A groupoid with identity element is called loop

#### Example

(i) The structure  $(\mathbb{N}, +)$ ,  $(\mathbb{N}, \cdot)$ ,  $(\mathbb{Z}, +)$ ,  $(\mathbb{Z}, \cdot)$ ,  $(\mathbb{Q}, +)$ ,  $(\mathbb{Q}, \cdot)$ ,  $(\mathbb{R}, +)$ ,  $(\mathbb{R}, \cdot)$ ,  $(\mathbb{C}, +)$ ,  $(\mathbb{C}, \cdot)$  are all commutative group.

(ii) The set  $\mathbb{N}$  is not a groupoid with respect to the operation '-'.

Since if  $a, b \in \mathbb{N}$  then  $a-b$  is not always a natural number

### Semi-Group

A set equipped with associative binary operation is said to be semi-group or If  $G$  be set and  $*$  be an operation on  $G$  s.t  $\forall a, b \in G, a * b \in G$  -closure.

Or

Let  $G$  be a non-empty set and  $*$  be a binary operation defined on it, then the structure  $(G, *)$  is said to be a semi group if  $a * (b * c) = (a * b) * c \quad \forall a, b, c \in G$  (Associative)

### Remarks

A semi –group is an associative groupoid .

If the operation  $*$  also satisfies the commutative property , the structure  $(G, *)$  is called a commutative semi-group.

- (i) The structure  $(\mathbb{N}, +), (\mathbb{N}, \cdot), (\mathbb{Z}, +), (\mathbb{Z}, \cdot), (\mathbb{Q}, +), (\mathbb{Q}, \cdot), (\mathbb{R}, +), (\mathbb{R}, \cdot), (\mathbb{C}, +), (\mathbb{C}, \cdot)$  are commutative semi-group.
- (ii) The structure  $(\mathbb{Z}, -), (\mathbb{Q}, -), (\mathbb{R}, -), (\mathbb{C}, -)$  are not semi-groups. Since associative law is not satisfied.

### Monoid

Let  $G$  be a non-empty and  $*$  be a binary operation defined on it. Then the structure  $(G, *)$  is said to be a monoid if the following axioms are satisfied.

- (i) Associative law

$$a * (b * c) = (a * b) * c \quad \forall a, b, c \in G$$

- (ii) Existence of Identity : There exist an element, denoted by  $e$  and called the identity, in  $G$  such that  $a * e = a = e * a \quad \forall a \in G$ .

### Remarks

- (i) A semi-group having the identity element is called a monoid.
- (ii) If the operation  $*$  is also commutative ,then the structure  $(G, *)$  is called a commutative monoid.
- (iii) Every monoid has a unique identity element.

Example (a)

The structure  $(\mathbb{Z}, +), (\mathbb{Z}, \cdot), (\mathbb{Q}, +), (\mathbb{Q}, \cdot), (\mathbb{R}, +), (\mathbb{R}, \cdot), (\mathbb{C}, +), (\mathbb{C}, \cdot)$  are monoids.

(b) The structure  $(\mathbb{N}, +)$  is a semi-group ,but not a monoid, since the additive identity (i.e 0) does not exists in  $\mathbb{N}$ .

## Groups

Let  $G$  be a non-empty set and  $*$  be a binary operation defined on it, then the structure  $(G, *)$  is said to be a group if the following axioms are satisfied

- (i) Closure property  
 $a * b \in G \quad \forall a, b \in G$
- (ii) Associativity

The operation  $*$  is associative on  $G$  i.e

$$a * (b * c) = (a * b) * c \quad \forall a, b, c \in G$$

- (iii) Existence of Identity  
There exists an element  $e \in G$  such that  $a * e = a = e * a \quad \forall a \in G$ ,  $e$  is called identity of  $*$  in  $G$ .

- (iv) Existence of Inverse  
For each element  $a \in G$  there exist an element  $b \in G$  such that the element  $b$  is called the inverse of element  $a$  with respect to  $*$ , and we write  $b = a^{-1}$
